## Cylindrical Screening Machines

ISO 9001 - 2008  
QUALITY ASSURANCE

Ürün Kodu/Product Code **CS 300 / 500 / 700**

# Cylindrical Screening Machines

Cylindrical screening machines are used for sorting and grading of seeds and cereals such as grain, maize, sunflower seed, rice and similar commodities. Also generally granular products such as recycling products.

The incoming material is sorted according to its width (round perforation) and respectively its thickness (slotted perforation).

All kernels thinner than the screen holes fall through the screen, and all thicker kernels remaining in the screening cylinder are transported to the end-outlet.

By means of the permanent circulation of the product and the resulting centrifugal force, each kernel is forced to be in contact with the screen perforation, enabling sorting operations to be carried out with high accuracy.

The single cylinders built as self supporting steel constructions can be joined in various configurations by means of the simple modular system, always using only one drive motor (Energy saving) with chain drive connection to the single cylinders. A maximum of 3 cylinders can be installed above each other.

So a huge spectrum of sorting targets can be covered.

## ASSEMBLY UNITS:

Screen box

The screen box houses the screening cylinder.

Screen cylinder

On the CS300 and CS500 type it is a single-sieve push on cylinder.

The CS700 type has 3 screen segments which are attached on supporting discs.

Vibrating trough

The vibrating trough is used to feed the product falling through the upper screening cylinder to the inlet of the next cylinder. When arranged as lowest unit it will collect all throughs and convey them to a discharge pipe.

Deflector box

The deflector box is used to deflect the product falling through the upper screening cylinder so that it doesn't hit the lower cylinder so as to by-pass the following cylinder.

Discharge hopper

It is invariably arranged as lowest assembly of the equipment, it's only to collect the throughs and tailings in troughs from where they are piped out through suitable conduit.

## FEATURES

- The drive can be equipped with fixed or variable speed (by frequency inverter or by mechanical speed variator gear).
- Permanent screen cleaning too prevent blockage of the screen-holes.  
(additional hand operated cleaning device or brush rollers can be installed as an alternative)
- Adjustable Screen-inclination for regulation of the throughput-capacity.  
(steplessly adjustable between 0 and 2,5°)
- Simple screen-exchange

Parallel operation

The grain flow is divided to the separate inlet channels of each single cylinder, so they receive part of the grain flow at a time. The oversize product is discharged at the end of each cylinder. The product failing through will direct by the deflector box so as to by-pass the following cylinder.

Series operation

The product falling through the upper screening cylinder is fed to the inlet of the next cylinder by means of a vibrating trough. The oversize product is discharged at the end of each cylinder.
